Read about some of the different birds that call Bhutan home and find and circle the **BOLDED** words in the word search.

WARD'S TROGON is one of two species of trogons found in Bhutan. Trogons are medium sized, colorful birds that feed on fruits and insects and nest in cavities.

The Great **HORNBILL** like other hornbills, is recognizable by its large, ridged beak. Hornbills eat different types of fruits and small animals. They nest in tree cavities.

The Himalayan **MONAL** is a rainbow-colored pheasant that lives in forests and shrubby areas above 2,000 meters.

The **LAUGHINGTHRUSH**es are a group of birds that are known for having relatively weak flight. They mainly eat insects, berries and sometimes lizards.

The **IBISBILL** is a relatively large shorebird with a distinct downcurved bright red bill. It is strikingly marked with gray and white feathers and a dark black band across its upper breast.

The Himalayan **CUTIA**'s scientific name, *Cutia nipalensis*, translates to "the Khutya from Nepal."

Himalayan **GRIFFON** is a large vulture native to the Himalayas. Like most vultures, it feeds on carrion.

Green-billed **MALKOHA** is a type of cuckoo found in dry scrub forests throughout much of Asia. It has a large down-curved bill and a red face patch around its eyes.

Named for its bright red tail, the Fire-tailed **MYZORNIS** lives in subtropical and tropical moist montane forests of Bhutan.

Little **FORKTAIL** is a small, black and white bird that is found near waterfalls, puddles and streams.

Tawny **FISH-OWL** is one of several fish-owl species in Asia. It feeds on crabs, frogs, shrimps and fish.

Named for its bright yellow coloring, the Golden **BABBLER** lives in subtropical lowland and montane forests.

BEE-eaters eat mainly winged insects, particularly wasps and bees. There are 27 species of bee-eaters in the world.
